### **Veterinary Report - Rosemont Stud**

**Date: 08/05/2024**

**Horse: Capital Call**

**Sex: Gelding**

**Colour: Bay**

The horse Capital Call was examined by me on 8 May 2024 at Rosemont Spelling farm. The presenting history was that the gelding was mildly sore bilateral on its front limbs. At today's examination the horse was ambulating well, trotted a grade 1 out of 5 lame on the right hindlimb. The horse was still mildly sore bilaterally on both front feet which is likely to be barefoot. The gelding was reactive to palpation along the R lumbar region extending towards the pelvis and hamstrings. There was no significant joint effusion or swelling noted on the right hind limb.

Based on the above clinical findings, it is highly likely that the gelding has strained or developed a tear along the R lumbar region causing discomfort. The horse has been placed on a short course of anti-inflammatories (Phenylbutazone) and will be re-examined. Other options for this gelding may include ultrasound of the R lumbar or regional intramuscular injection along the region with corticosteroids or shockwave therapy.

Should you require any additional information, please do not hesitate to contact me.

Regards

Dylan Lau BVSc (Hons)
