At the time of examination the horse was not shod. The mare was in good health, but light condition.

Conformation was generally correct. Hoof wall growth and structure was good in all four feet.

There was no lameness at the walk and trot.

The external reproductive system was normal.. An ultrasound exam of the ovaries showed no activity, and a normal reproductive tract with no folds or fluid.

Within the limits of this examination the horse represents a normal risk for breeding.
